Feb 20 Update

Work Completed

- Generalization over Reynolds number
  - Re-run training at $Re = 430$
  - Show dependence of g's for trained $Re = 430$
- Explanation
  - Can we improve performance if we train with 'weaker' normalization (maybe $\tau' = 100\tau$) so that all features are of comparable size? **Tough to train!**

Work In Progress

- Benefits of reduced description
  - Posteriori tests for $Re = 240, 430$ - more stable?

Training at $Re = 240$

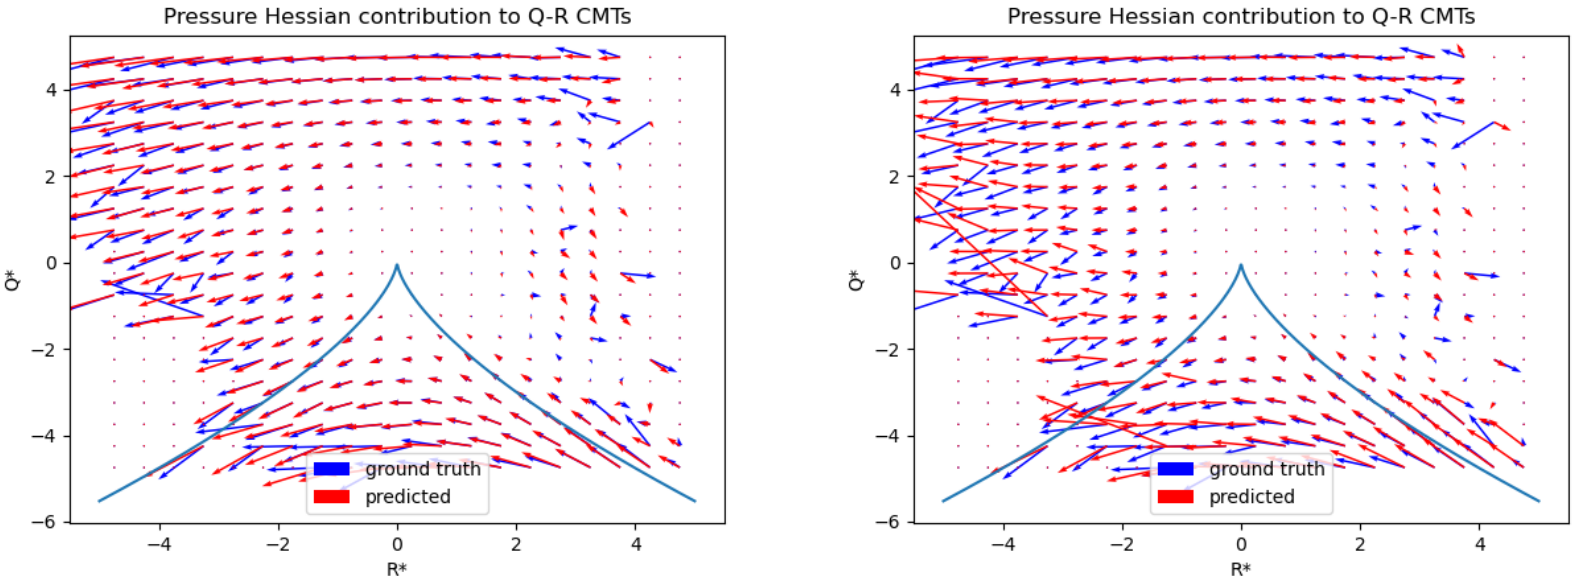

Figure: (left) Q-R CMTs for $Re = 240$ after training, and (right) Q-R CMTs for $Re = 240$ setting $\lambda_i = 0$ for $i = 3, 4, 5$, after training.

Training at $Re = 430$

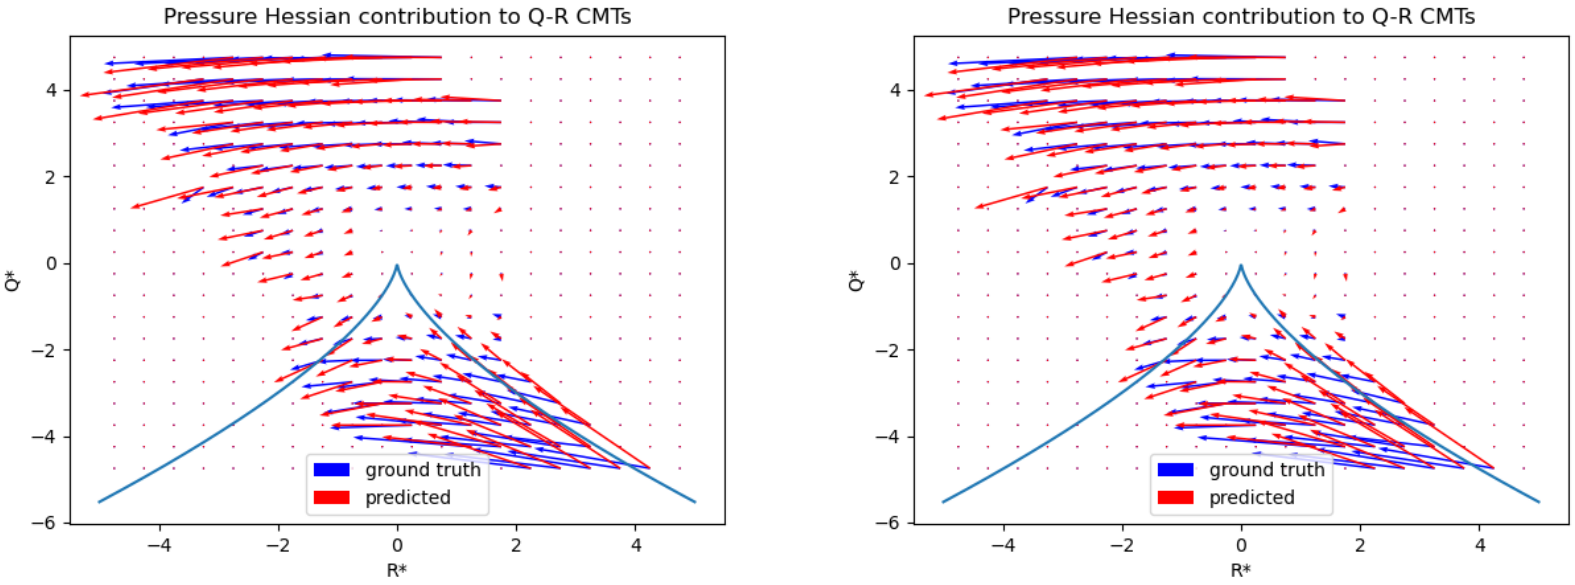

Figure: (left) Q-R CMTs for $Re = 430$ after training using exact same architecture as $Re = 240$ data, and (right) Q-R CMTs for $Re = 430$ setting $\lambda_i = 0$ for $i = 3, 4, 5$, after training.
